

CLAIMS

1. What I claim as my invention is an identification bracelet for children with a unique locking mechanism.

The bracelet, which is made of Polyurethane (no PVC material is used), is manufactured in one piece with a locking construction that immediately releases under a certain amount of tension that could otherwise cause injury to the child, however the material ensures that the identification bracelet does not break nor will the data be destroyed. This is prevented by the mechanism of the locking construction, which consists of two lines each with eight points and rounded spaces in between the points. When the points are inserted in the triangular opening, which is smooth-edged on the inside, and stretched further on to the three rectangular openings, that fastens the bracelet, the points will lock in the triangular opening thus functioning like barbs. The rounded spaces and the smooth-edged opening will however result in an easy release when the bracelet is subjected to a certain amount of tension, thus leaving the identification bracelet intact. The end of the bracelet is inserted through the smooth-edged sides of the triangular opening and further on to one of the three rectangular openings/straps each one able to hold the end of the bracelet in place and thereby preventing an untimely release whereby the bracelet could slide off the wrist of the child.

2. What I claim as my invention is an identification bracelet for children that allow companies and organizations to use the front of the identification bracelet for commercial/promotional purposes.

The bracelet provides companies and organizations with a new, inexpensive marketing/promotional tool whereby e.g. company logos, slogans, messages, drawings or figures identified with the company or the organization is advertised amongst children and parents, where the former may very well regard the identification bracelet as a collectors item and the latter may view the bracelet

as a useful and indispensable ready-at-hand gadget that also provides the company or organization with a friendly and caring image.

3. What I claim as my invention is an identification bracelet for children that contains the contact information on the inside of the bracelet as supposed to on the top or front of the bracelet.
